

Client: BP

Location: Sunbury

Sector: Commercial

Project value: £200,000.00

Project: Head Office – Atrium Lighting Project

Brief

Our client, BP, asked that we replace their existing lighting within their three level atrium office area to high level energy efficient lighting. This had to be carried out within a live working environment and it was of upmost importance to the client that there was no disruption to their employees or loss of power, during the course of the works.

Action

The existing wiring was stripped out and replaced with T5 low level linear energy efficient lighting. This comprised of various Iguzzini luminaires controlled by a Simmtronic lighting control system to light the atrium and reception area below. LED flood lights were also installed on the columns to up-light the atrium.

Outcome

Throughout the project BP's employees were carrying out their day to day business and JCA were extremely careful that no disruption was caused. The atrium area was completely open plan and works were carried out in close proximity to employees. JCA insisted on the highest levels of professionalism and consideration from its team and was proud of the way in which the works were conducted.
